

# At last! A low cost master time clock for CCTV installations

Conventional master reference clocks, especially network-enabled systems, can cost a fortune. TIMENET provides an integrated GPS receiver and master NTP time server solution in a single compact device and at a price suitable for even the smallest CCTV systems.

Ideal for the closed network systems typically found in CCTV installations, TIMENET installs in minutes, can be mounted on an indoor wall, and is not subject to radio interference. The tiny GPS antenna is mounted on or near a window, and links directly into the TIMENET unit with a 3m cable. The unit is patched directly into the network with a standard CAT5 cable (up to 100m) and provides a continuously updated reference time based on the GPS atomic clock system. TIMENET is fully NTP compatible and will work with any DVR or other network devices designed to synchronise to NTP signals.

TIMENET is supplied with a very simple program for setting the IP address.
